

FLUXIDI

Business Page Guide

For business owners, dispatchers and independent drivers

A detailed English guide based on the full company flow: settings, publishing, bookings, drivers, vehicles, payments, refunds, documents, Demand Radar and smart dispatch.

English version 1.0 - detailed feature and usage guide

- No screenshot dump: first the complete logic and usage explanation.
- QR/link are entry points; the app is the strongest customer flow.
- Smart dispatch checks availability, route, planning and margin.
- A separate Flemish Chiron/Peppol guide can follow later.

Fluxidi Business Page Guide

English version 1.0 - detailed feature and usage guide

Purpose of this guide

This guide is written from the perspective of a business owner who wants to use Fluxidi in daily operations. It does not only list buttons. It explains why those buttons matter, what happens when they are used, what the customer sees, what the company sees, what the driver sees, and which automatic flows Fluxidi supports.

Use this document as a practical operating guide for the company page. It is meant to reduce support questions, but also to build trust: Fluxidi is not just a visual app, it is designed to make taxi and mobility operations clearer, safer and more automated.

How to read this guide

Start with Business Home and Company Settings when configuring Fluxidi for the first time. Then continue with publishing, the booking link, the customer app and the public partner profile before going live.

Use the sections about vehicles, drivers and smart dispatch to prevent operational mistakes. Use payments, refunds, receipts, documents and compliance for administration and follow-up.

A separate Flemish Chiron/Peppol guide can be created later for deeper regional compliance. This main guide keeps the company-page flow clear for all business users.

1. Start, security and the company menu

Protecting the app with a PIN code

Fluxidi can be protected with a PIN code. This matters because the app can contain sensitive business information: customer details, bookings, driver data, vehicles, payment statuses, documents and company settings.

The PIN is an extra protection layer when a tablet or phone is left open, shared inside the business or used on the road. A company device can be in a vehicle, at the office or with a driver. Without protection, someone could access the business environment without permission.

Use a code the responsible person can remember, but only share it with people who are allowed to access the company environment. Where possible, combine it with device security such as screen lock or biometrics.

How to use this in practice

- Set the PIN when the device is first prepared for business use.
- Test whether the app asks for the PIN again after lock or restart.
- Keep the code safely with the business owner.

The company menu in the top-right corner

When logged in as a company, a dropdown menu is available in the top-right corner. This menu is not decoration: it contains important actions for management, recovery, language and support.

In this menu you can find Company details, Help & guide, Pair new device, possibly switch company, and the language choices Dutch, English, French and Spanish.

The business owner mainly uses this menu when checking company data, pairing a new device, asking for help, or switching the app language.

How to use this in practice

- Open Business Home.
- Tap the company card or dropdown in the top-right corner.
- Choose Company details, Help & guide, Pair new device or language.

FLX company code and recovery

Every company has a public Fluxidi code, such as FLX-00001. This code is more important than it may look at first sight.

The FLX code helps identify your company, connect your public booking link to the correct environment and recover the business when a device is lost or replaced.

For recovery, the combination of the FLX code and the official company email address is especially important. That official email is entered in Company details and must be correct.

How to use this in practice

- Store the FLX code safely with your business administration.
- Check that the official company email address is correct.
- Use these details when a device must be paired or recovered.

Fluxidi tip: Do not treat the FLX code as a random label. It is a key element for support, recovery and your public booking flow.

Pairing a new device

With Pair new device, Fluxidi generates a temporary code that can connect another device to the same company environment.

This is intended for a new tablet, an extra company device, a replaced phone or a lost device. The company does not have to start again from zero.

After pairing, the company sees its data, settings, vehicles, drivers and relevant business environment again on the new device.

How to use this in practice

- Open the top-right company menu.
- Choose Pair new device.
- Let Fluxidi generate a temporary pairing code.
- Use that code on the new device.
- After pairing, check that the correct company environment is visible.

Important: Only share a temporary pairing code when you intentionally want to connect a new company device.

Language choice: NL / EN / FR / ES

Fluxidi supports Dutch, English, French and Spanish. This is important for companies active in several regions or with drivers who speak different languages.

Language choice can change the interface, buttons and explanations. In some sections, such as the driver view, the language can be switched directly on that page.

How to use this in practice

- Open the menu with language choice.
- Choose Dutch, English, French or Spanish.
- Check that the main screens display in the chosen language.

2. Business Home and daily company control

Business Home as the central cockpit

Business Home is the starting point for the business owner or dispatcher. It shows the most important company information and quick actions for Settings, Subscription, Vehicles, Chiron, Drivers, Driver View, Demand Radar, Booking Link and Bookings.

At the top-left you see the Fluxidi logo or the company logo. This logo can be replaced in Company Settings by the company's own logo. This gives the business environment a stronger white-label and professional feel.

Business Home is intended as a daily cockpit: at a glance you see what is open, what is completed, which revenue is visible and which actions are quickly accessible.

How to use this in practice

- Open Business Home after logging in as a company.
- Check the greeting and company name.
- Use the quick actions as the main route to the important modules.

The four business indicators

The four counters show planned/open bookings, completed rides, unpaid rides and monthly revenue.

Open bookings show what still needs to happen. Completed rides show what has already been performed. Unpaid rides need administrative follow-up. Monthly revenue gives a quick impression of how the month is going.

These counters are useful because the business owner does not have to open every detail page to get a first operational picture.

How to use this in practice

- Check open bookings at the beginning of the day.
- Check unpaid rides regularly.
- Use monthly revenue as a quick indicator, not as a replacement for accounting.

Responsive portrait and landscape layouts

Fluxidi has polished portrait layouts and adapted landscape layouts. Some screens intentionally reorganize when the device is rotated.

On a phone, portrait can be more visual or more compact. In landscape, Fluxidi may arrange elements differently to keep buttons, maps and management actions usable.

This matters for drivers, vehicles, documents and management pages. A function can show as a quick overview in portrait, while landscape shows full management.

How to use this in practice

- Test Business Home, Vehicles, Drivers and Driver View in portrait and landscape.
- Use portrait for a fast overview.
- Use landscape when you need wider management or more columns.

Fluxidi tip: If a button appears missing on a phone, rotate the device before assuming the function is unavailable.

3. Settings: base data, themes, branding and technical status

Settings loaded or not loaded

At the top of Settings, Fluxidi can show whether settings are loaded. This matters because company settings must be fetched from the backend or local storage.

If settings are not loaded, there may be a connection problem, backend issue or synchronization problem. Do not blindly make large changes in that situation.

Wait until the correct data is visible and trustworthy. Reopen the page or check the connection when needed.

How to use this in practice

- Open Settings.
- Check at the top whether settings are loaded.
- Only change data when the correct company information is visible.

Theme appearance for company, driver and mobile views

Theme settings define how Fluxidi looks in different roles. For the business view, themes such as Executive Gold, Corporate Blue, Clean Professional, Emerald Ivory and Fluxidi Neon Rush may be available.

For the driver view, themes such as Night Gold, Midnight Blue and Midday Gold can be available. The driver cockpit can therefore visually match the professional style of the company.

The mobile taxi view or driver start page can be compact or visual. Compact is useful when speed and clarity matter. Visual uses more imagery and atmosphere. In phone landscape, Fluxidi can intentionally show a more compact layout.

How to use this in practice

- Choose a business theme that matches your brand.
- Choose a driver theme that remains readable during daily use.
- Check phone portrait and landscape after changing compact/visual options.

Branding and support

In Branding and support, you enter data that customers and partners can see. This includes company logo, language, default currency, tax label, 24-hour notation and support details.

Currency can be EUR, USD, GBP or CHF. Tax labels can be BTW, VAT, TVA, IVA, GST or tax, depending on country and target audience.

These settings influence how professional and locally correct your company appears.

How to use this in practice

- Upload a clear company logo.
- Check language, currency and tax label.
- Check whether 24-hour notation fits your region.
- Enter support details correctly.

4. Official company details, recovery and document text

Official company details

Here you enter the legal and administrative base of the company: official name, address, postcode, city, email addresses, website, IBAN and other references.

The official email address is very important for recovery. Together with the FLX code, it can be used to restore or reconnect a business to a device.

There can also be separate email fields for bookings and invoicing. The booking email can receive booking notifications; the billing email is relevant for the subscription, invoices and company administration.

How to use this in practice

- Enter the official company name exactly.
- Check the official email address for recovery.
- Enter booking and billing emails deliberately.
- Enter website and IBAN if relevant.
- Save the company details.

IBAN, payment reference and footer

IBAN is the company bank account that can support payments, refunds or administrative handling. This information must be correct.

The payment reference prefix, for example FLX, helps make payments recognizable. A clear prefix makes administration easier.

The invoice or ride receipt footer is text that can appear at the bottom of documents, for example "Thank you for your trust in Fluxidi". This is small, but it contributes to a professional impression.

How to use this in practice

- Check IBAN carefully.
- Choose a recognizable payment reference prefix.
- Enter a clean footer for invoices and ride receipts.
- Save the changes.

5. Subscriptions and billing

Purpose of the subscription page

Under Settings you will find Subscriptions. This page shows the current subscription, usage and limits, drivers, vehicles, PDF creations, Peppol, paid extensions and extra capacity.

A company can see how much capacity is included and when an upgrade is needed. Examples include an extra vehicle, extra driver, Peppol sending or extra PDF bundles.

The guide should not freeze prices if the commercial offer can still change. The active price shown in the app is leading.

How to use this in practice

- Open Subscriptions.
- Check the current plan.
- Check usage and limits.
- Review which extensions are active or available.

Included platform module and extensions

The platform module can include base management, own company appearance, online booking flow, PDF ride receipts within limits, WhatsApp/email ride receipts, compliance overview, Chiron Ready and Peppol Ready structure.

A base plan can start with one vehicle, one driver and an included number of PDF creations. Extra vehicles or drivers can be added separately according to the active offer.

Peppol Ready means the structure is prepared for professional electronic invoicing or document exchange. Exact sending or bundles depend on the active module.

How to use this in practice

- Check vehicle and driver limits.
- Check PDF limits.
- Activate extensions only when needed.
- Use the subscription page as the source for current prices.

6. Public booking link, QR code and customer app

Public company code and link

Every company has a public FLX code and a unique booking link with company_code. Through that link the customer opens the online web calculator or booking flow of that company.

The page shows the public company code, the link and a QR card with the company name and FLX code. This makes it clear which company the QR code belongs to.

The buttons Copy code, Copy link, Share QR, Share and Open link help spread or test the link and QR code.

How to use this in practice

- Use Open link to test what the customer sees.
- Copy the link for website, email or WhatsApp.
- Share QR with hotels, partners, printer or vehicles.
- Place the QR code on business cards, flyers, websites and vehicles.

Why the app is stronger than QR alone

QR code and link are perfect entry points, but the Fluxidi app is the strongest fixed flow for returning customers.

In the app, the customer can more easily book again, follow bookings, view ride history, find ride receipts and understand status updates.

For the company, app usage means fewer loose WhatsApp messages, less manual copying and better automatic flow into planning and the driver view.

How to use this in practice

- Encourage new customers to scan the QR code.
- Afterwards, encourage regular customers to use the app.
- Explain that the app is easier for repeat bookings and receipts.

Fluxidi tip: Use the QR code as the bridge. Use the app as the long-term customer relationship channel.

7. Public partner profile and visibility in the app

Publishing as a digital partner profile

Publishing does not only mean that a link exists. It means your company becomes visible as a partner profile inside the Fluxidi app.

Customers can see company name, branding, verification status, services, vehicles, drivers and buttons such as Taxi or Airport.

This is the real importance of publishing: customers recognize your company in the app and can start the correct flow from the profile.

How to use this in practice

- Enter postcodes where you are active.
- Use current location as company location if correct.
- Set radius according to your service area.
- Choose public services you actually offer.
- Add public media and logo.

Postcodes, radius and services

Postcodes determine where your company can be found in Nearby taxis. If a customer searches in a region that matches your postcodes, your company can appear.

The radius determines how widely your service area is visible. Too small a radius can miss opportunities; too large a radius can show unrealistic rides.

Services such as Taxi & VVB, Airport transport, Business rides, Events, Hotels & B&B and Online payment determine what customers see on your profile.

How to use this in practice

- Enter only regions where you genuinely want to drive.
- Enable only services you really offer.
- Check the partner profile as a customer.

Payment options visible to customers

You can show payment options such as Bancontact, Apple Pay, Google Pay, PayPal, cash, QR code, Tikkie, Payconiq, Wero, iDEAL, Carte Bancaire, Bizum, online payment and bank transfer.

The order or visibility can be influenced by country. Belgian, Dutch, French and Spanish users recognize different payment methods.

Only show payment options that you genuinely support or can clearly process.

How to use this in practice

- Check country setting.
- Select relevant payment options.
- Test the customer flow.
- Do not enable everything without operational support.

8. Google Calendar and planning outside Fluxidi

Connecting Google Calendar

With the Google Calendar connection, future bookings can automatically appear in the calendar. This gives an additional planning overview alongside Fluxidi.

When bookings change, are completed or are cancelled, calendar information can automatically update or disappear depending on the flow.

Fluxidi remains the main source for ride status, payment status, driver and documents. Google Calendar is an additional overview.

How to use this in practice

- Connect Google Calendar from settings.
- Check whether new bookings appear in the calendar.
- Check whether cancellations update the calendar.
- Set reminders in Google Calendar itself.

Calendar reminders

Google Calendar also lets you configure notifications. You can choose to receive a reminder a chosen time before the ride starts, for example 10 minutes, 30 minutes or 1 hour.

This is useful for business owners, dispatchers or drivers who also follow their rides in a calendar view.

Fluxidi tip: Set reminders in Google Calendar, but keep Fluxidi as the operational source of truth.

9. Receiving payments, VAT and refunds

Receiving payments and Mollie

In this section the company configures how payments are received. For online payments, a company payment provider account such as Mollie can be connected so payments are linked to the correct company.

Do not describe this as “test” in customer documentation. Explain that companies manage payment details, account and payment options here according to the active production configuration.

Online payment requires correct provider settings. Paying in the vehicle remains a separate flow: cash, terminal or another local method.

How to use this in practice

- Check payment provider.
- Check IBAN and company details.
- Test online payment.
- Test payment in the vehicle.
- Check payment status after a test booking.

VAT settings

VAT settings are linked to the calculator, ride prices, documents and invoicing. You can set the VAT rate and choose whether prices are shown including or excluding VAT.

This matters because price expectations differ for customer and company. A wrong rate or wrong inclusive/exclusive setting can create discussion.

How to use this in practice

- Set VAT rate.
- Choose inclusive or exclusive.
- Test the calculator after changes.

- Check receipt or invoice display.

Refunds and provider confirmation

For paid cancellations or corrections, a refund may be needed through Mollie or another provider. A refund is not always immediately final and visible.

The flow is: start refund, provider processes it, provider confirms it, Fluxidi updates payment and refund status. Time can pass between the action and the green/final status.

After a credit or refund, the booking appears again under Cancelled bookings with refund status such as Refunded when confirmed.

How to use this in practice

- Check bookings to credit.
- Process refund if needed.
- Wait for provider confirmation.
- Check the cancelled booking again for refund status.

Important: Do not promise a customer that a refund is instantly visible. Provider confirmation can take time.

10. Price Engine, services and cancellation policy

Price Engine / calculator

The Price Engine is the calculation engine of Fluxidi. It determines how ride prices are calculated.

Settings can include start fare, price per kilometer, price per minute on top of kilometers, minimum fare, waiting fee, luggage fee, stop fee, comfort/private surcharge, night surcharge, weekend surcharge, maximum surcharge, return rides, return surcharge and fuel surcharge.

Everything here can affect the calculator, customer price, driver price indication and ride receipt.

How to use this in practice

- Change fares deliberately.
- Test a short ride, long ride and airport ride.
- Check waiting time and surcharges.
- Check the receipt after a test.

Service setup and extra options

In Service setup you decide which services customers can see or request: airport passenger transport, business rides, urgent courier, care transport, events, special rides, pets, comfort, private, premium, extra options, drinks service or work table.

These choices influence the public profile, the booking flow and customer expectations.

Only activate services the company can genuinely perform.

How to use this in practice

- Select services.
- Check the public partner profile.
- Test the booking flow for important services.
- Check whether vehicles and drivers match the service.

Airport fixed fares

Airport transport is already available in Fluxidi and the airport transport calculator is integrated into the booking flow.

For airports, fixed fares can be configured. This gives customers faster clarity, especially for rides to Brussels Airport, Charleroi, Zaventem or other airports.

Fixed fares can be linked to radius or region. Check them regularly when fuel, parking, waiting time or distances change.

How to use this in practice

- Enter relevant airports.
- Choose radius or region.
- Set fixed price.
- Test airport booking.
- Check price card and customer flow.

Cancellation policy and smart blocking

With the cancellation policy you decide until when a customer can cancel by themselves. For example 60 minutes for taxi or 1440 minutes (24 hours) for airport transport.

When the customer tries to cancel too late, the app can show that cancellation is no longer possible and that the customer must contact the driver or company.

Fluxidi can also block cancellation intelligently when the driver is already on the way. The system uses coordinates and operational context to prevent a customer from cancelling when the company has already made costs or travel effort.

How to use this in practice

- Set cancellation window per service.
- Test early cancellation.
- Test late cancellation.
- Check the customer message.
- Check cancelled booking and refund flow.

11. Vehicles

Vehicle page and counters

The Vehicles page shows the company fleet. At the top are three counters: registered vehicles, vehicles linked to the company and active vehicles.

A vehicle can be registered but not active. Only active and correctly linked vehicles should be used operationally.

The vehicle card shows photo, vehicle name, brand/model, license plate, category, passenger capacity, luggage capacity, linked driver, permits and registration data.

How to use this in practice

- Open Vehicles.
- Check the counters.
- Check photo, license plate, capacity and linked driver per vehicle.
- Use Edit to complete missing data.

Editing a vehicle and linking a driver

In the edit screen, enter vehicle name, brand, model, license plate, exploitation permit, registration, VIN/chassis, color, passenger capacity, luggage capacity, category, active status and linked driver.

If no driver exists, a driver can be created from the vehicle page. A driver set to inactive should not be linked to a vehicle for operational use.

The driver-vehicle link matters for the booking flow, driver view, dispatch, documents and administration.

How to use this in practice

- Complete vehicle data.
- Choose comfort/private/premium.
- Set vehicle active if usable.
- Select an active driver.
- Save and check the vehicle card.

Public vehicle photos

Public photos can be used per vehicle on the partner profile or in customer-facing parts of the app. Up to five photos can be added.

This builds trust: customers can see what type of vehicles the company uses. Especially for premium, airport transport, hotels or business rides, this strengthens the impression.

How to use this in practice

- Use professional photos.
- Only make photos public if customers may see them.
- Check the partner profile after publishing.

12. Chiron, compliance, checklist and local ride register

Checklist & preparation

Chiron/Compliance is a preparation and control center. The checklist looks at the whole company, not at one driver only.

It checks company profile readiness, legal name, registration/KBO, VAT profile, address/postcode/city, contract and email fields.

It also checks driver readiness, vehicle readiness and document statuses: total documents, approved, pending, expired, expiring within 30 days or missing document cloud/status.

How to use this in practice

- Open Chiron/Compliance.
- Click Checklist & preparation.
- Check company profile, drivers, vehicles and documents.
- Solve attention points.

Backend messages / Chiron

Backend messages show detailed results of rides, payment updates and synchronization. These records are intended for registration, traceability and Chiron/compliance follow-up.

You can see details such as planned ride or street ride, date, booking number, plan number, result, sync status, paid/unpaid, payment method, source, vehicle, provider, payment update and ride status.

These messages are not a normal list to reset casually. They help understand later what happened technically and administratively.

How to use this in practice

- Use backend messages for control.
- Compare ride status and payment status.
- Use them for support or audit questions.

Local ride register and documents

The local ride register gives the business owner practical actions: refresh, view details, create ride receipt, create PDF invoice, share and remove locally.

This local register is more practical than backend messages. The business owner can consult rides, create documents and share information.

Audit history shows additional details such as distance, planned, paid, status and more. From the register, ride receipt and PDF can be used for administration or customer questions.

How to use this in practice

- Open the local ride register.
- Use details or audit history.
- Create ride receipt or PDF if needed.
- Only share when ride and payment data are correct.

13. Managing drivers

Portrait and landscape

The Drivers module has two usage layers. In portrait, you see a quick overview. At the top there may be a message asking you to rotate the device for full driver management.

In landscape there is more room for editing, deleting, adding documents, pairing codes, temporary QR codes and settings.

This matters: if a user does not see everything in portrait, it does not mean the function is missing. Some management actions intentionally live in the full landscape view.

How to use this in practice

- Use portrait for a quick overview.
- Rotate the device for full management.
- Use landscape for documents, codes and editing.

Driver counters and card

The Drivers module shows counters for total drivers, drivers in pause, active drivers and inactive drivers.

Pause means temporarily unavailable. Inactive means not operationally usable and not participating in vehicle linking or the booking flow.

The driver card shows profile photo, name, review score, phone number, status chips such as Active and Available, linked vehicle/license plate, document status such as Docs 2/7 and a progress bar.

How to use this in practice

- Check the counters.
- Check status and availability per driver.
- Check vehicle link.
- Check document status.

Adding a driver and driver profile

When adding a driver, enter name, chauffeur ID/driver ID, phone number, card number and expiry date. You can add a profile/passport photo.

In the profile you decide whether the driver is publicly visible, whether the photo is publicly visible, and whether name/photo appear on the public partner profile or driver card.

Customers can leave a review score after a ride. That score can be visible to the business owner, driver and possibly future customers depending on public settings.

How to use this in practice

- Complete driver data.
- Upload photo if desired.
- Choose public visibility consciously.
- Set driver active or inactive.
- Save.

Documents and driver pairing

At the bottom of the driver page, documents can be viewed, added and managed. Examples include driving license, driver pass, identity document, permit/inspection and other documents.

Pairing codes or temporary QR codes can be used to link a driver to a device without sharing full company rights.

When a driver is created here, that driver can later be selected and linked to a vehicle on the Vehicles page.

How to use this in practice

- Open documents.
- Add missing documents.
- Check expiry date.
- Use code/QR for device pairing when available.
- Link driver to vehicle.

14. Driver View as the operational cockpit

Purpose and top bar

Driver View is the daily cockpit for the driver. It shows logo, language switcher, profile photo, active status, pause/resume, driver name, counters and the next upcoming ride.

The logo comes from company settings. The language can be chosen directly on the page: Dutch, English, French or Spanish.

The pause button is availability. It is separate from active/inactive. A driver can be active, but temporarily in pause.

How to use this in practice

- Check logo and language.
- Check driver status.
- Use pause when temporarily unavailable.
- Use resume when available again.

Next upcoming ride and map

The next planned ride is central. Fluxidi shows it prominently, with Mapbox/street overview so the driver immediately understands where to go.

The system takes the driver's current location into account. The driver can first navigate to the customer and then start the ride.

This means the dispatcher does not need to manually forward all details. The ride flows from the booking flow to the company and driver.

How to use this in practice

- View the next ride.
- Check pickup and destination.
- Open navigation to the customer.
- Start the ride when execution begins.

Start ride, navigation, waiting time and price

Start ride opens a destination popup. For street rides, Fluxidi uses the current location and entered destination to create a price indication based on the Price Engine.

In navigation you see logo, status indicator, ETA, kilometers, euros, start button, wait button and Google Maps/Waze buttons.

Wait uses the waiting time settings from the calculator. External navigation can be used, but Fluxidi remains important for status, price and registration.

How to use this in practice

- Enter destination.
- Check estimated price.
- Use Start when the ride begins.
- Use Wait when the customer asks to wait.
- Use Google Maps or Waze if desired.

History, receipts and PDF sharing

In History, the driver sees counters for total, cancelled, completed and revenue. Filters show all rides, completed rides and cancelled rides.

A ride receipt shows company name/logo, plan number, type/subtype, outbound/return, start/stop, route, distance, waiting time, total price, customer details if available, service, tier, passengers, luggage, extra options, status and payment status.

PDF actions can include view, share, WhatsApp, email and print. WhatsApp can open and the user may need to search/select the customer number. Email can be prefilled if the customer provided an email.

How to use this in practice

- Open History.
- Open receipt.
- Check customer details.
- Choose PDF view/share/WhatsApp/email/print.
- Ask for customer details if missing.

My rides and documents

My Rides has tabs such as Available, My rides and History. Newly available rides and assigned rides can appear here and be refreshed.

Documents shows document status, profile photo, required documents, approved/missing/rejected/expired, uploaded documents, expiry date, cloud status and open/add actions.

Sensitive documents must be stored securely and encrypted. Privacy matters because driving license, ID and permits contain personal information.

How to use this in practice

- Use Refresh on My rides.
- Check document status.
- Open uploaded documents if needed.
- Add missing documents.

Business owner preview

When Driver View is opened from company settings, the business owner can sometimes switch drivers and see what a driver sees.

This is useful to check settings, review documents, test rides and guide drivers without leaving the company context.

How to use this in practice

- Open Driver View from the company.
- Switch driver if needed.
- Check rides, documents and availability.
- Return to the company page.

15. Bookings, planning and follow-up

Four indicators and automatic intake

Bookings/planning shows four indicators: Open/planned, Completed, Cancelled and To credit.

Every booking via the app or QR/web flow automatically appears in the company overview, ordered with the next rides at the top.

This automatic intake is the core: customer data, route, time, price and status arrive structured, without everything having to be copied from WhatsApp or phone.

How to use this in practice

- Check Open/planned daily.
- Use Completed for history and administration.
- Check Cancelled for cancellations and refund status.
- Use To credit as a temporary follow-up bucket.

Completed and cancelled bookings

Completed bookings show details such as start point, destination, driver, vehicle, payment status, ride status and price. They can be hidden when the overview becomes too busy.

Cancelled bookings show what was cancelled and whether the ride was paid or unpaid. After credit/refund, the booking returns to Cancelled with refund status.

Paid cancellations require extra care: the customer can be told to contact the company, after which the business owner handles refund or credit.

How to use this in practice

- Open Cancelled.
- Check paid/unpaid.
- Check full credit and refund status.
- Hide rides only for overview, not to lose information.

Automatic updates and Chiron events

When the business owner cancels or processes a refund, the booking should automatically update for customer and driver. The driver must not keep executing a cancelled ride.

Chiron/compliance automatically receives events around cancellation, payment, refund and status change. This keeps a trace of what happened.

This prevents misunderstandings and strengthens administration.

How to use this in practice

- Check customer status after cancellation.
- Check Driver View.
- Check Chiron/compliance event.
- Check provider confirmation for refund.

16. Smart dispatch control inside the booking flow

What Fluxidi already does

Fluxidi already has smart dispatch control inside the booking flow. This is not the same as a future separate AI Dispatch cockpit, but it is already smart operational logic.

When a customer books, Fluxidi checks whether the ride is feasible. The system does not only look at date and time, but also at vehicle, driver, availability, location and planning.

This helps Fluxidi avoid overbooking and unrealistic rides.

How to use this in practice

- Keep vehicles active when usable.
- Keep drivers active and not in pause when available.
- Link driver to vehicle.
- Make sure locations are available.
- Test a booking at a busy moment.

Concrete checks

Fluxidi can check how many vehicles exist, which vehicles are active, which drivers are active or inactive, which drivers are paused, which driver is linked to which vehicle, where the driver is or was last known, where the customer must be picked up, and whether the driver can arrive in time.

The system also considers existing planned rides, trip duration, overlap and feasibility. The goal is not to accept as many rides as possible, but to accept rides that can realistically be performed.

A safety margin of about 15 minutes is included to absorb traffic, parking, finding the customer, luggage, waiting time and route differences.

How to use this in practice

- Check driver status.
- Check vehicle status.
- Check pause.

- Check location context.
- Check that rides are not planned too tightly.

What the customer sees when there is no availability

If there is no feasible driver or vehicle available, the customer receives a clear message that there is no driver available at that moment.

That is better than confirming a ride the company must cancel later. It protects customer trust and company reputation.

For the company this means fewer manual corrections and less stress afterwards.

How to use this in practice

- Test a moment with no availability.
- Check the customer message.
- Check that no unrealistic booking is confirmed.

17. Demand Radar / Region Radar

Purpose of Demand Radar

Demand Radar shows aggregated regional interest and potential customers within the company's service zone.

At the top, the company sees the number of potential customers, the postcode/region and the configured service radius, for example 30 km around a postcode.

The Mapbox map shows aggregated demand with markers. The information is regional and anonymous; it is not intended to track individual customers.

How to use this in practice

- Open Demand Radar.
- Check potential customers.
- Check radius and postcode.
- View the regional map.
- View postcode-level demand.

Why customer app usage should be encouraged

Demand Radar becomes stronger when customers use or sign in through the Fluxidi app. More regional context becomes available and the company can better understand where interest appears.

For customers, this gives confidence: they see active companies nearby. For companies, it shows where demand may arise and where visibility or partnerships can be useful.

Combine Demand Radar with partner profile, QR code, hotels, events and airport transport to recognize ride opportunities.

How to use this in practice

- Encourage customers to use the app.
- Promote QR/link in the right region.
- Use postcode demand to evaluate service area.

18. Connected ecosystem: airport, events, hotels, stays and taxi

Airport and nearby stays

Airport rides are connected to stays and mobility. An airport customer can also view nearby stays. From a stay, taxi or transfer becomes a logical next step again.

This makes Fluxidi more than a ride form: it connects airport, accommodation and transport in one customer journey.

How to use this in practice

- Show the airport flow.
- Use nearby stays.
- Let the customer book taxi/transfer from context.

Events and hotels/B&B

Events can show nearby stays. Hotels and B&Bs can show events or places nearby. At locations or events, a button such as Taxi to this event or Taxi to this company can send the customer directly into a booking flow.

This is commercially strong: a customer viewing an event or hotel is led to transport at the right moment.

Stay22 can be used for stays; Booking.com can be added later when the integration is available.

How to use this in practice

- Use events as a ride opportunity.
- Use hotels/B&B as a partner channel.
- Use Taxi to this event/company as a direct booking flow.
- Use Stay22 as the stay connection.

19. Go-live checklist

Before going live

Before sharing the booking link or QR code, the base must be fully checked. This checklist prevents customers from seeing a half-configured profile or bookings from going operationally wrong.

How to use this in practice

- Company details and FLX code checked.
- Official recovery email entered.
- Logo and branding configured.
- Services and Price Engine tested.
- VAT inclusive/exclusive checked.
- Payment methods and Mollie/provider tested.
- Public partner profile published.
- Booking link and QR code tested.
- Customer app flow tested.
- Vehicles added and active.
- Drivers added, active and linked.
- Documents and expiry dates checked.
- Cancellation policy tested.
- Google Calendar tested if used.
- Smart dispatch tested with availability/pause.
- Full test booking completed from start to finish.
- Receipt/PDF/refund flow checked.

Closing note: what this guide is meant to do

A practical business guide

This guide is meant to help customers independently understand how the company page works. It should reduce support questions, but also create trust.

Fluxidi is not only designed to look good. It is designed to make daily taxi and mobility operations safer, clearer and more automated for the company, the driver and the customer.
