

FLUXIDI

Customer brochure - full product edition

Fluxidi Platform Brochure

White-label taxi and mobility software for modern fleets

For taxi companies, dispatchers, drivers, airport transfers and growing mobility fleets.

A clear customer brochure that explains what Fluxidi does without turning the document into a technical audit.

Fluxidi at a glance

Fluxidi brings the daily operation of a taxi company into one clear platform. The customer sees a professional brand, the driver gets a practical working environment and the company keeps control.

Operations	Bookings, pricing, dispatch, vehicles, drivers, ride status and live follow-up.
Commercial growth	Public booking link, QR, partner profile, hotels, events, airport flows and Region Radar.
Finance	Online payment, pay in vehicle, refunds, credits, receipts, invoices and payment status.
Compliance	Documents, local ride register, compliance events, Chiron and Peppol-oriented administration.
White-label	Logo, themes, company profile, public presence and multilingual customer experience.

1. What is Fluxidi?

Fluxidi is a professional mobility platform for taxi companies and private-driver services. It is not a separate booking app, but a complete digital work system: customers book, drivers drive, dispatchers follow up and the company manages everything from one cockpit.

- One platform for business, driver and customer.
- White-label by design: every company works with its own name, look, tariffs, rules and public booking link.
- Suitable for street rides, planned rides, airport transfers, public bookings, events, hotels and partners.
- Built for multilingual European operations with clear documents, payment flows and company control.

2. Who is Fluxidi for?

Fluxidi is built for companies that want more than a calendar, WhatsApp and separate payment requests. It helps small teams start professionally and supports larger fleets with more structure.

- Taxi companies with several drivers and vehicles.
- Independent drivers who want a more professional workflow.
- Airport transfers and premium mobility services.
- Hotels, restaurants, event venues and business partners that send ride requests.
- Fleets that need transparency around availability, payments, receipts and documents.

3. The main roles

Fluxidi brings roles together without forcing everyone into the same interface. Each user sees the workflow that matches the job.

Role	What this user gets
Business / dispatcher	Cockpit, bookings, drivers, vehicles, tariffs, branding, reporting and settings.
Driver	Own rides, navigation, live status, documents, trip history, payments and direct-ride calculator.
Customer	Booking, payment, ride status, booking history, partner discovery and profile management.
Public visitor	Book through QR or link, view a company page or show demand in a region.

4. From booking to completed ride

The booking flow reduces manual follow-up. The customer gets clarity, the driver gets context and the company stays in control.

- Customer or dispatcher enters pickup, destination, date, time, passengers, luggage and preferences.
- Fluxidi calculates the price based on tariffs, distance, time, service class and airport fixed fares.
- The platform checks availability and prevents the same capacity from being sold twice.
- The customer chooses online payment or pay in vehicle, according to company settings.
- After confirmation, booking, driver, vehicle, payment and documents are followed centrally.
- After the ride, receipts, payment status, history and compliance information remain available.

5. Dispatch and overbooking prevention

Fluxidi does not only check whether “a driver” exists. It considers vehicles, capacity, overlapping rides, planning and availability.

- Vehicle and driver assignment per company.
- Checks for passengers, luggage, service class and existing reservations.
- Availability logic to avoid double planning.
- Auto-dispatch after paid online bookings.
- Diagnostics when no suitable vehicle is available.
- AI-assisted dispatch as a smart layer on top of the existing dispatch base.

6. Payments

Fluxidi supports modern payment flows while respecting the reality of taxi work: some rides are paid online, others in the vehicle or through a business arrangement.

- Online payments through Mollie with Bancontact, card and PayPal, depending on country and configuration.
- Pay in the vehicle for cash, terminal or manual handling.
- QR payment for fast payment experiences.
- Pending online payments can be resumed.
- Payment status is visible in customer, driver and company flows.
- Per-company payment configuration so each company can manage its own payment policy.

7. Cancellations, refunds and credits

A professional fleet needs clear rules. Fluxidi supports cancellation policy, payment status, refund follow-up and credit decisions.

- Cancellation rules per company and per booking type.
- Difference between unpaid, online-paid and business rides.
- Customer cancellation with clear conditions.
- Company cancellation and follow-up in the business dashboard.
- Full and partial refunds for paid rides.
- Credits and manual decisions remain visible in the ride file.

8. Drivers, vehicles and documents

Fluxidi centralizes the operational core of the fleet: who drives, with which vehicle, with which documents and with which status.

- Driver profiles with login or pairing code.
- Vehicle management with capacity, plate, type, status and driver link.
- Driver documents such as driving licence, taxi card, identity document and medical documents.
- Document statuses and control inside the company environment.
- Driver app with own rides, available rides, history, navigation and payments.
- Themes and compact or visual layouts for the driver experience.

9. White-label branding per company

Every taxi company gets its own digital brand layer on top of the same Fluxidi engine.

- Own company name, logo, contact details, VAT details and public profile.
- Own themes for business cockpit, driver view and customer experience.
- Public booking link and QR code in the company style.
- Receipts and documents with company details.
- Own tariffs, airport prices, cancellation policy, payment options and service classes.
- Professional appearance without building custom software.

Core idea: for the customer, Fluxidi feels like the taxi company's own platform, while Fluxidi remains the engine behind it.

10. Customer experience and public booking

The customer can book, pay, follow up and find rides without relying on separate messages.

- Public booking link and QR for websites, vehicles, hotels and partners.
- Customer profile, booking history and ride details.
- Clear payment status and ride status.
- Partner profiles with vehicles, drivers, services and payment methods.
- Multilingual experience in Dutch, English, French and Spanish.
- Region Radar lets customers show interest in regions where demand appears.

11. Airport, events, hotels and partners

Fluxidi supports not only regular taxi rides, but also commercial growth channels around mobility.

- Airport flows with fixed fares, passenger information and return possibilities.
- Event Locator to stimulate rides around events.
- Hotel module to bring accommodation and taxi booking closer together.
- Partner profiles for hotels, restaurants, companies and local collaborations.
- Affiliate and deeplink structures for travel possibilities.
- Region Radar helps companies see where demand and commercial opportunities appear.

12. Navigation and live tracking

Drivers need practical route support and companies want to know where rides stand operationally.

- In-app map and navigation support for drivers.
- Live tracking and ride status for follow-up.
- Navigation banner and cockpit view on the road.
- Handoff to familiar navigation tools such as Google Maps and Waze where useful.
- Mapbox-based route and map functions inside the app.

- Tracking information connected to ride, driver, vehicle and company.

13. Receipts, invoices, Chiron and Peppol

Professional customers expect clear documents. Fluxidi brings ride information, payment, company, customer and compliance together in usable documents.

- Receipts and PDF documents with company details, route, price, VAT, payment and ride details.
- Sharing by email, WhatsApp, print or download.
- Invoice-oriented structure for business customers.
- Chiron/compliance dashboard for ride register, messages, checklist and follow-up.
- Peppol-oriented administration for professional invoicing and digital document flows.
- Compliance events store important ride and payment moments per company.

14. Backend, security and reliability

Fluxidi is built as a multi-tenant platform. Each company works separately, with its own sessions, settings, data and company context.

- Cloudflare Workers for booking, tracking and compliance.
- Tenant and company separation between businesses.
- Separate sessions for business, driver and customer.
- Scoped storage for bookings, drivers, vehicles, documents and events.
- Backend diagnostics for availability, dispatch, payments, documents and dashboards.
- Designed for professional growth without forcing smaller companies to manage technical complexity.

15. Why this matters for a fleet

Fluxidi brings several separate tools into one workable system. That gives a fleet more control, less manual work and a more professional appearance toward customers.

- Fewer loose WhatsApp messages and manual payment follow-up.
- More clarity for customer, driver and dispatcher.
- Better control over planning, capacity and availability.
- Stronger brand presence through white-label branding.
- More commercial opportunities through public links, QR, hotels, events and partners.

- More trust through clear receipts, documents, security and compliance.

Fluxidi helps taxi companies work as modern mobility organizations: professional for the customer, practical for the driver and clear for the company.
